SUMMARY

I'm a Software Engineer dedicated to solving product problems by designing and developing scalable, resilient, and secure solutions.

My core expertise is in Go and microservices, with a strong emphasis on API-first design.

I believe that a good developer experience, fast feedback loops and automated testing are essential for productivity and reliable outcomes.

I am committed to continuous learning and knowledge sharing within the team.

My skillset encompasses designing solutions for complex problems, with technical proficiency in Go, and experience in other languages like in Python, Ruby, C and Java. I'm also interested in the functional paradigm, and I have played around using Kotlin, Clojure and Scala

EDUCATION

Universidade Estadual do Oeste do Paraná, Brazil **December 2011**
B.S. in Computer Science

EXPERIENCE

Schwarz Media Plataform April 2022 - Present
Senior Software Engineer *Germany*

As a member of the ad delivery team, my responsibilities included proposing architecture and system designs, writing technical design documents, and implementing the corresponding software; defining and maintaining our service within its SLOs; developing data pipelines, and onboarding and sharing knowledge with fellow team members.

Highlights

- Design Bigtable storage to make it simpler from a developer perspective and also more performant.
- Improve overall developer experience with a local environment.
- Migrate a complex pipeline from Kubeflow to Airflow.

Main technologies: Go, Kubernetes, Docker, Postgres, gRPC, gRPC-Gateway, Airflow, Google Cloud Platform (Kubernetes Engine, Bigtable, Bigquery, Pub/Sub, Cloud Build), Helm, Prometheus, Grafana.

Onefootball February 2021 - March 2022
Senior Software Engineer *Berlin, Germany*

As a member of the news team, I was jointly responsible for ensuring the data delivered to our users remained current and precisely tailored to their individual interests. A significant challenge in this role involved scaling our services to adeptly manage a high volume of requests per second, including sudden traffic spikes that could amplify request loads by an order of magnitude within moments.

Highlights

- Responsible for the BFF and event architecture initiatives, which were adopted successfully by other teams later.
- Fine tune relational database that improved performance up to 70%.

Main technologies: Go, Kubernetes, Docker, AWS, NATS, RabbitMQ, MySQL, Helm, Prometheus, Grafana.

FromAtoB May 2019 - February 2021
Senior Software Engineer *Berlin, Germany*

On the Data Platform team, I was responsible for externalizing and processing data from a variety of Go and Ruby-based services, consolidating it within our data warehouse and data lake. A critical aspect of my role involved diligent monitoring to ensure these data processes operated correctly and consistently yielded high-quality data. This foundational work directly empowered our data science teams, providing them with the essential data to drive product improvements and develop innovative features, including user-facing tools like price calendars and price alerts.

Highlights

- Design and implement the whole data platform.
- Create a POC of a price calendar using Bigtable.

Main technologies: Go, Python, Ruby, Kubernetes, Docker, Postgres, gRPC, gRPC-Gateway, Airflow, Google Cloud Platform (Kubernetes Engine, Cloud Run, Cloud Functions, Bigtable, Bigquery, Pub/Sub, Cloud Build, Dataflow), Helm, Prometheus, Grafana.

Neoway Business Solutions May 2016 - March 2019
Software Developer *Florianópolis, Brazil*

As a member of the Data Source team, I was primarily responsible for developing, maintaining and optimizing a fleet of over 300 web scraping bots targeting diverse internet sources. To enhance development efficiency and reliability, we developed a framework upon Scrapy. My role also involved architecting and developing various support services in Go, including storage and proxy solutions.

Subsequently, I adapted this framework concept for the Data Analytics team, which significantly accelerated their model development lifecycle and improved operational reliability. This initiative enabled the team to deploy their models in multiple formats, such as Python packages, Dockerized Flask APIs, and Spark jobs, thereby increasing their time to market, versatility and impact.

Highlights

- Promote workshops to share knowledge and regular 1x1 with the team members.
- Improve and replicate with another team the framework to streamline the development and deployment process.

Main technologies: Go, Python, RabbitMQ, Kubernetes, Docker, AWS, Google Cloud Platform.

DBA Technology May 2013 - May 2016
Software Developer *Florianópolis, Brazil*

As a key team member at a DBA startup, I contributed significantly to the Parking Meter System project, engaging in all development phases. This included defining requirements, building the web application with Ruby on Rails, designing the database schema, and conducting thorough testing.

To ensure connectivity with peripheral hardware, I engineered a dedicated backend API using Ruby/Grape. This enabled the system to interface effectively with tablets, parking meters, and a range of sensors.

I also took ownership of creating the first iteration of the Android application, utilizing a suite of modern libraries (RxAndroid, Retrofit, SqlBrite, ButterKnife, Dagger, Espresso, Robolectric) to build a functional and responsive user interface.

Highlights

- Start the system from scratch, being responsible for collecting requirements, implementing them, and delivering them to the users.

Main technologies: Ruby, Python, Android, AWS.
